WISIOGENOUS LEUKEMIA CELL LINE KG-1, LEUKEMIA U937 CELL LINE, IN MYSIOGENOUS LEUKEMIA CELL LINE KG-1, LEUKEMIA U937 CELLS. IN BONE MARROW CELLS, PLACENTA, AND PERIPHERAL BLOOD GRANULOCYTES. THE GCSFR-2 FORM HAS BEEN FOUND ONLY IN LEUKEMIA U937 CELLS. THE GCSFR-3 FORM IS HIGHLY EXPRESSED IN PLACENTA.

I-- DISEASE: Defects in CSF3R might be a cause of severe congenital neutropenia (SCN) in some patients.

I-- SIMILARITY: Contains 5 fibronectin type III domains.

I-- SIMILARITY: Contains 1 immunoglobulin-like C2-type domain.

I-- SIMILARITY: BELONGS TO THE CYTOKINE FAMILY OF RECEPTORS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               STRUCTURE BY NMR OF 227-334.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to isolated polynucleotide (I) and CD polypeptide (II) sequences. (II) is useful as hybridisation probes, CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags CC for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating CC imaging of sites expressing (II). (I) and (II) are useful for treating CC imaging of sites expressing (II). (I) and (II) are useful for treating CC diagnostics, foremaics, gene mapping, identification of mutations cresponsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and CC anino acid sequences. ABG00010-ABG30377 represent novel human CC diagnostic amino acid sequences of the invention.

Note: The sequence data for this patent did not appear in the printed are ferring the product of the printed of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches

The zcytor17 antirheumatic, antiarthritic and muscular activities. The zcytor17 cantirheumatic, antiarthritic and muscular activities. The zcytor17 cantirheumatory, spleenic, blood or bone disorders. Agonists or anti-zcytor17 antibodies are useful in stimulating cell-mediated immunity and for stimulating lymphocyte proliferation, such as in the treatment of infections involving immunosuppression, including certain viral infections. They are also useful for inducting cytotoxicity and for treating leukopenias. Antagonist of zcytor17 polypeptides are useful for treating autoimmune diseases (e.g. rheumatoid arthritis and multiple sclerosis), inflammatory diseases (e.g. Crohn's disease), cancer, pancreatitis, and inflammatory bowel disease. Zcytor17 was mapped to chromosome 5, specifically to the 5q11 chromosomal region. ABA93767 to ABA93843 and ABB05730 to ABB05730 to ABB05745 represent sequences used in the

(I) have immunomodulator and haemostatic activities. The proteins and encoded genes are applicable in searching for novel haematopoietic factors, and developing remedies for immunological and haematopoietic diseases. The haematopoietic receptor genes participate in in vivo immunomodulation and haematopoietic cell regulation, and in the search for haematopoietic factors capable of functionally binding to the receptors. The present sequence represents the human NR10.4

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes haematopoietic receptor NR10 splicing variants (1). (1) have immunomodulator and haemostatic activities. The proteins and encoded genes are applicable in searching for novel haematopoietic factors, and developing remedies for immunological and haematopoietic diseases. The haematopoietin receptor genes participate in in vivo immunomodulation and haematopoietic cell regulation, and in the search for haematopoietic factors capable of functionally binding to the receptors. The present sequence represents the human NR10.4

CC treating cell proliferation conditions such as leukaemia and tumour cells. HPR sequences are also useful for treating gell proliferation conditions and excess of bone-resorbing CC cells. HPR sequences are also useful for treating medical conditions and Cd diseases such as cell proliferation, metabolic and reproductive hormone CC ellated conditions. They are useful for treating various haematologic and concologic disorders e.g., Epstein-Barr virus-positive masopharyngeal CC carcinoma, myslogenous leukaemia, colon, stomach, prostate, renal cell, CC cervical and ovarian cancers, lung cancer (SCLC and NSCLC), including CC cancer-associated cachexia, fatigue, solid tumours (e.g., osteosarcoma, CC sarcoma), carcinoma (e.g., adenocarcinoma (for example, breast cancer), CC squamous cell carcinoma), haematologic disorders, anaemias (e.g., anaemia CC of chronic disease, aplastic anaemia, Fanconi's saplastic anaemia), myelo-CC dysplastic syndromes (including refractory anaemia, refractory anaemia (c.g., anaemia CC paenic purpura (ITP), sickle cell vasocclusive crisis, myelofibrosis/CC myeloid metaplasia, osteoclast disorders that lead to bone loss such CC as osteoporosis including post-menopausal osteoporosis, periodontitis (c.g., anaemia including creutsfeld-Jacob disease, demyelianin-Barra syndrome, vertebral disc disease, demyelianin gravis, chronic neuronal degeneration, stroke including cerebral ischaemic diseases. HPRL and HPR2 polypeptides are also useful cerebral ischaemic diseases. HPRL and HPR2 polypeptides are also useful constitutions of the constitution o

                                                                                                                                                                                                                            2 Cytor17 has immunomodulatory, antiinflammatory, antiviral, cytostatic, cantirheumatic, antiarthritic and muscular activities. The zcytor17 cytostatic, antirheumatic, antiarthritic and muscular activities. The zcytor17 cytor17 cytor17 cytor17 cytor17 cytor17 antibodies are useful for treating lymphoid, immune, immune, spleenic, blood or bone disorders. Agonists or anti-zcytor17 antibodies are useful in stimulating cell-mediated immunity and for stimulating lymphocyte proliferation, such as in the treatment of infections involving immunosuppression, including certain viral infections. They are also useful for inducting cytotoxicity and for treating leukopenias. Antagonist of zcytor17 polypeptides are useful for treating autoimmune diseases (e.g. rheumatoid arthritis and multiple sclerosis), inflammatory diseases (e.g. Crohn's disease), cancer, pancreatitis, and inflammatory bowel disease. Zcytor17 was mapped to chromosome 5, specifically to the 5q11 chromosomal region. ABA93767 to ABA93843 and ABB05730 to ABB05745 represent seguences used in the cemplification of the present invention.

NR10 occurs as a transmembrane protein and a soluble protein. NR10 is a haemopoietin receptor molecule which participates in immunoregulation and haematopoietic cell regulation in vivo, and is useful in searching for haematopoietic factors capable of binding to the receptor. NR10 can be used for the identification of substances for the treatment and prevention of immune and haematopoietic disorders including autoimmune diseases and allergies and haematopoietic disorders including autoimmune diseases and allergies

Human and murine hematopoietin receptor useful for treating cell proliferation, hormone related conditions polypeptides HPR1 and HPR2, metabolic, and reproductive

Disclosure; Page 112-115; 136pp; English

CC carcinoma, myelogenous leukaemia, colon, stomach, prostate, renal cell, CC cervical and ovarian cancers, lung cancer (SCLC and NSCLC), including CC carcer-associated cachexia, fatigue, solid tumours (e.g., osteosarcoma, carcinoma), carcinoma (e.g., adenocarcinoma (for example, breast cancer), CC squamous cell carcinoma), haematologic disorders, anaemias (e.g., anaemia of chronic disease, aplastic anaemia, Fanconi's aplastic anaemia), myelo-dyplastic syndromes (including refractory anaemia, refractory anaemia curvità ringed sideroblaste or with excess blasts), idiopathic thrombocyto-dyplastic purpura (ITP), sickle cell vasocclusive crisis, myelofibrosis/ curvità myelodimetaplasia, osteoclast disorders that lead to bone loss such cas osteoporosis including post-menopausal osteoporosis, periodontitis cresulting in tooth loosening or loss, prosthesis loosening after joint replacement, neurodegenerative conditions (e.g., acute polyneuropathy, curvitations (e.g., acute polyneuropathy, The present invention relates to human and murine haematopoietin receptor polypeptides HPR1 and HPR2. Sequences of the invention are useful for treating cell proliferation conditions e.g., pancytopaenia, leukopaenia, anaemia, thrombocytopaenia, neurodegenerative disorders and osteoporosis resulting from a lack of bone-forming cells. They are also useful for treating cell proliferation conditions such as leukaemia and tumour metastasis, osteoporosis resulting from an excess of bone-resorbing cells. HPR sequences are also useful for treating medical conditions and diseases such as cell proliferation, metabolic and reproductive hormone related conditions. They are useful for treating various haematologic and oncologic disorders e.g., Epstein-Barr virus-positive nasopharyngeal carcinoma, myelogenous leukaemia, colon, stomach, prostate, renal cell, myasthenia gravis, chronic neuronal degeneration, stroke including cerebral ischaemic diseases. HPR1 and HPR2 polypeptides are also useful for treating various other disorders such as osteoporosis, obesity, mammary development and infertility.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ğ
The present invention describes a cytokine receptor designated zcytor17. CC Zcytor17 has immunomodulatory, antiinflammatory, antivital, cytostatic, CC antirheumatic, antiarthritic and muscular activities. The zcytor17 CC antirheumatic, antiarthritic and muscular activities. The zcytor17 CC proteins are useful for treating and diagnosing lymphoid, immune, CC anti-zcytor17 antibodies are useful in stimulating lymphoid as in the immunity and for stimulating lymphocyte proliferation, such as in the CC treatment of infections involving immunosuppression, including certain cyiral infections. They are also useful for inducting cytotoxicity and CC viral infections. They are also useful for inducting cytotoxicity and CC for treating leukopenias. Antagonist of zcytor17 polypeptides are useful for treating autoimmune diseases (e.g. rheumatoid arthritis and multiple colerosis), inflammatory diseases (e.g. Crohn's disease), cancer, CC pancreatitis, and inflammatory bowel disease. Zcytor17 was mapped to CC chromosoma 5, specifically to the 5q11 chromosomal region. ABA93767 to

                                                                                                                                                                                                                                                                    The present invention describes haematopoietic receptor NR10 splicing variants (I). (I) have immunomodulator and haemostatic activities. The proteins and encoded genes are applicable in searching for novel haematopoietic factors, and developing remedies for immunological and haematopoietic diseases. The haematopoietin receptor genes participate in in vivo immunomodulation and haematopoietic cell regulation, and in the search for haematopoietic factors capable of functionally binding to the receptors. The present sequence represents the human NR10.3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              exemplification

                                                                                                                                                                                                                                                                                                                                                                      The present invention describes haematopoietic receptor NR10 splicing variants (I). (I) have immunomodulator and haemostatic activities. The proteins and encoded genes are applicable in searching for novel haematopoietic factors, and developing remedies for immunological and haematopoietic diseases. The haematopoietin receptor genes participate in in vivo immunomodulation and haematopoietic cell regulation, and in the search for haematopoietic factors capable of functionally binding to the receptors. The present sequence represents the human NR10.4 exon CP10.4 amino acid sequence from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        NR10 splicing variants of hematopoietin receptor proteins and encoded genes, applicable in searching hematopoietic factors and developing remedies for immunological and hematopoietic diseases

                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes haematopoietic receptor NR10 splicing variants (I). (I) have immunomodulator and haemostatic activities. The proteins and encoded genes are applicable in searching for novel haematopoietic factors, and developing remedies for immunological and haematopoietic diseases. The haematopoietic receptor genes participate in in vivo immunomodulation and haematopoietic cell regulation, and in the search for haematopoietic factors capable of functionally binding to the receptors. The present sequence represents the mouse mNR10Balb-to the receptors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     NR10 splicing variants of hematopoietin receptor proteins and encoded genes, applicable in searching hematopoietic factors and developing remedies for immunological and hematopoietic diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   NR10; splicing variant; haematopoietin receptor; immunomodulator; haemostatic; haematopoietic factor; immunological disease; haematopoietic cell regulation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         treating cell proliferation conditions such as leukaemia and tumour metastasis, osteoporosis resulting from an excess of bone-resorbing cells. HPR sequences are also useful for treating medical conditions and diseases such as cell proliferation, metabolic and reproductive hormone related conditions. They are useful for treating various haematologic and oncologic disorders e.g., Epstein-Barr virus-positive nasopharyngeal carcinoma, myelogenous leukaemia, colon, stomach, prostate, renal cell, cervical and ovarian cancers, lung cancer (SCLC and NSCLC), including cancer-associated cachaxia, fatigue, solid tumours (e.g., osteosarcoma,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to human and murine haematopoietin receptor polypeptides HPR1 and HPR2. Sequences of the invention are useful for treating cell proliferation conditions e.g., pancytopaenia, leukopaenia, anaemia, thrombocytopaenia, neurodegenerative disorders and osteoporosis
                                                                Mus musculus
                                                                                                                              haematopoietic

(I) have immunomodulator and haemostatic activities. The proteins and encoded genes are applicable in searching for novel haematopoietic factors, and developing remedies for immunological and haematopoietic diseases. The haematopoietic receptor genes participate in in vivo immunomodulation and haematopoietic cell regulation, and in the search for haematopoietic factors capable of functionally binding to the receptors. The present sequence represents the mouse mNR10c57BL-6 profess from the present sequence represents the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             NR10 splicing variants of hematopoietin receptor proteins and encoded genes, applicable in searching hematopoietic factors and developing remedies for immunological and hematopoietic diseases

                                                                                                                                                                                                                                                             The present sequence represents a human haemopoietin receptor protein (NR10), specifically designated NR10.1. NR10 occurs as a transmembrane protein and a soluble protein. NR10 is a haemopoietin receptor molecule which participates in immunoregulation and haematopoietic cell regulation in vivo, and is useful in searching for haematopoietic factors capable of binding to the receptor. NR10 can be used for the identification of substances for the treatment and prevention of immune and haematopoietic disorders including autoimmune diseases and allergies such as metal and pollen allergy.

       Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Score
